ACKNOWLEDGEMENTS

Special acknowledgement is due the State Planning Office who provided state total population bases (hereafter referred to as partial populations) for five age groups for ten successive years into the future.

Under the general guidance of Ellen Naor, Director of the Division of Data and Research, Bureau of Health Planning and Development, this report was produced by Dale Welch, Senior Researcher. Deputy Division Director, William Perry, provided technical assistance and consultation in developing the statistical methodology. The cover was designed by Bruce Armstrong and the report was typed by Sue Whitley.

INTRODUCTION

This report presents a series of annual population projections beginning with 1981, the most recent year for which estimates have been calculated, and continuing with yearly projections ten years into the future. This is the third series of small area population projections prepared by the Bureau of Health Planning and Development and the first to show minor civil division populations by age group.

This publication contains two separate reports. The first report shows the projected population totals through 1991 for each minor civil division in Maine. The second report shows the projected population of 12 age groups by sex through 1991 for the state and each of the 16 counties.

This publication may be purchased for $5.00 per copy from:

The Division of Data and Research
Bureau of Health Planning and Development
Department of Human Services
State House Station #11
Augusta, Maine 04333

The following unpublished reports are also available:

1. Population projections by county and town through 1991 for each of the age groups: under 5, 5-17, 18-44, 45-64, and 65 and over. Price $22.50 per copy.

2. Population projections by county by sex through 1991 for each of the age groups: under 5, 5-17, 18-44, 45-64, and 65 and over. Price $5.25 per copy.

3. Population projections by county by sex through 1991 for each of the age groups: under 5, 5-9, 10-14, 15-17, 18-19, 20-24, 25-34, 35-44, 45-64, 65-74, 75-84, and 85+. Price $4.50 per copy.

TECHNICAL NOTES

Methodology:

The projection methodology is based on consideration of age-specific partial populations. The age-specific partial population for a given geographic area in any year is the sum of the following two components:

(1) The age cohort aged forward the appropriate number of years from the date of the most recent population estimate.

(2) The projected net migration for the age cohort of the geographic area.

The age-specific partial population for a given age cohort thus excludes the natural increase of that cohort.

Age-specific partial populations for the state, for five age groups, were produced by the Maine State Planning Office for the years 1982 through 1991. Age-specific partial populations are then calculated for each Minor Civil Division (MCD) on the last census date (April 1, 1980) and on the date of most recent population estimates (July 1, 1981).* The proportion or share of the state age-specific partial population represented by each MCD's age-specific partial population is computed for April 1, 1980 and July 1, 1981. Using the assumption that the annual rate of change in each MCD's share of the state age-specific partial population between the last census date and the last date of population estimate will continue throughout the projecting period (1982-1991), the final projected age-specific partial population is calculated for each MCD for each year of the projecting period.

*Welch, D. "Population Estimates for Minor Civil Divisions by County, Maine, 1981", Maine Department of Human Services, Bureau of Health Planning and Development. December, 1982.

The final population projection for each age group in each MCD is produced by adding the projected natural increase of each age cohort to the projected partial population of each MCD.

The three basic assumptions inherent in these projections are listed below:

(1) There will be a very small increase in the birth rate during the next decade.

(2) There will be a very small decrease in the death rate during the next decade.

(3) The net migration pattern during the next decade for each MCD will be the same as during the 15 month period following the 1980 census.

It should be emphasized that the third assumption is by far the most critical factor in determining the quality of these projections, particularly for small geographic areas.

Rounding:

Projections of less than 100 are unrounded. Projections between 100 and 1,000 are rounded to the nearest 10 and projections greater than 1,000 are rounded to the nearest 50. The sum of a given component in these projections may not add to the state total because of these rounding procedures.

Accuracy of Projections:

Even though the state projections and the majority of the MCD projections appear to be quite reasonable, there are a number of MCD's with very unreasonable projections. Generally, these projections of poor quality can be classified into the three types listed below:

Type 1. Those due to a poor 1981 estimate.

Type 2. Those due to an unusually large rate of in-migration between April 1, 1980 and July 1, 1981.

Type 3. Those due to an unusually large rate of out-migration between April 1, 1980 and July 1, 1981.

Examples of these three types are Kennebunk (Type 1), Limestone (Type 2), and Belfast (Type 3).

We believe that Kennebunk, Kennebunkport and Arundel had poor 1981 estimates because of unreported private school enrollment. Therefore, the population projections for these towns are likely to be spuriously low.

Belfast had an unusually large outward migration in the 15 month period following the 1980 census due to the decline of the poultry industry. Since this was a one-time occurrence, the rate of out-migration probably will not continue at such a high level in future years. However, the projection methodology assumes the high outward migration will continue, resulting in a spuriously low projection.

Limestone, whose military base was gradually being phased out, was affected by a change in federal policy and experienced a large in-migration of military personnel between 1980 and 1981. Since this was very likely a one-time occurrence, the rate of in-migration will not continue at such a high level in future years. However, the projection methodology assumes the high rate of in-migration will continue, resulting in a spuriously high projection.

There are a number of towns in Sagadahoc County whose populations appear to be under-projected. We are not sure whether these apparent under-projections are Type 1 or Type 3.

Users of this report should be aware of the assumptions inherent in these projections. If the assumptions are not valid for the geographic area of interest, then the projections should be used with caution and adjustments to the projections may be necessary.

ACKNOWLEDGEMENTS

Special acknowledgement is due the State Planning Office who provided state total population bases (hereafter referred to as partial populations) for five age groups for ten successive years into the future.

Under the general guidance of Ellen Naor, Director of the Division of Data and Research, Bureau of Health Planning and Development, this report was produced by Dale Welch, Senior Researcher. Deputy Division Director, William Perry, provided technical assistance and consultation in developing the statistical methodology. The cover was designed by Bruce Armstrong and the report was typed by Sue Whitley.

INTRODUCTION

This report presents a series of annual population projections beginning with 1982, the most recent year for which estimates have been calculated, and continuing with yearly projections ten years into the future. This is the fourth series of small area population projections prepared by the Bureau of Health Planning and Development. It is the second to show, as a supplemental report, minor civil division populations by age group.

This publication contains two separate sections. The first section shows the projected population totals through 1992 for each minor civil division in Maine. The second report shows the projected population of 12 age groups by sex through 1992 for the state and each of the 16 counties.

The following supplemental reports are also available:

1. Population projections by county and town through 1992 for each of the age groups: under 5, 5-17, 18-44, 45-64, and 65 and over. Price $22.50 per copy.

2. Population projections by county by sex through 1992 for each of the age groups: under 5, 5-17, 18-44, 45-64, and 65 and over. Price $3.00 per copy.

3. Methodology for Maine population projections by county, age, and sex, Resource Series No. 11. Price $5.00 per copy.

TECHNICAL NOTES

Methodology:

The projection methodology is based on consideration of age-specific partial populations. The age-specific partial population for a given geographic area in any year is the sum of the following two components:

(1) The age cohort aged forward the appropriate number of years from the date of the most recent population estimate.

(2) The projected net migration for the age cohort of the geographic area.

The age-specific partial population for a given age cohort thus excludes the natural increase of that cohort.

Age-specific partial populations for the state, for five age groups, were produced by the Maine State Planning Office for the years 1983 through 1992. Age-specific partial populations are then calculated for each Minor Civil Division (MCD) on the last census date (April 1, 1980) and on the date of most recent population estimates (July 1, 1982).* The proportion or share of the state age-specific partial population represented by each MCD's age-specific partial population is computed for April 1, 1980 and July 1, 1982. Using the assumption that the annual rate of change in each MCD's share of the state age-specific partial population between the last census date and the last date of population estimate will continue throughout the projecting period (1983-1992), the final projected age-specific partial population is calculated for each MCD for each year of the projecting period.

*Welch, D. "Population Estimates for Minor Civil Divisions by County, Maine, 1982", Maine Department of Human Services, Bureau of Health Planning and Development. December, 1983.

The final population projection for each age group in each MCD is produced by adding the projected natural increase of each age cohort to the projected partial population of each MCD.

The following three basic assumptions are inherent in these projections:

(1) There will be a very small increase in the birth rate during the next decade.

(2) There will be a very small decrease in the death rate during the next decade.

(3) The net migration pattern during the next decade for each MCD will be the same as during the 27 month period following the 1980 census.

It should be emphasized that the third assumption is by far the most critical factor in determining the quality of these projections, particularly for small geographic areas.

A more detailed description of the methodology is presented in Resource Series Number 11, "Methodology for Maine Population Projections by County, Age, and Sex", published by the Bureau of Health Planning and Development.

Projections of less than 100 are unrounded. Projections between 100 and 1,000 are rounded to the nearest 10 and projections greater than 1,000 are rounded to the nearest 50. The sum of a given component in these projections may not add to the state total because of these rounding procedures.

Accuracy of Projections:

Even though the state projections and the majority of the MCD projections appear to be quite reasonable, there are a number of MCD's with very unreasonable projections. Generally, these projections of poor quality can be classified into the three types listed below:

Type 1. Those due to a poor 1982 estimate.

Type 2. Those due to an unusually large rate of in-migration between April 1, 1980 and July 1, 1982.

Type 3. Those due to an unusually large rate of out-migration between April 1, 1980 and July 1, 1982.

Examples of these three types are Hampden (Type 1), Bridgeton (Type 2), and Livermore Falls (Type 3).

We believe that Hampden and Hermon have poor 1982 estimates. This may be due to unreported private school enrollment. Therefore, the population projections for these towns are likely to be spuriously low.

Livermore Falls had an unusually large outward migration in the 27 month period following the 1980 census. Since this is likely to be a one-time occurrence, the rate of out-migration probably will not continue at such a high level in future years. However, the projection methodology assumes the high outward migration will continue, resulting in a spuriously low projection.

Bridgton, on the other hand, experienced an unusually high inward migration between April 1, 1980, and July 1, 1982. It is unlikely that this high rate of inward migration will continue into the future. However, the projection methodology assumes the high rate of in-migration will continue, resulting in a spuriously high projection for this town.

Users of this report should be aware of the assumptions inherent in these projections. If the assumptions are not valid for the geographic area of interest, then the projections should be used with caution and adjustments to the projections may be necessary.
